Scenario:

You are a young software developer who graduated from college two years ago with a bachelor's degree in computer science. At this point, you have a steady job and want to get into the dating scene to find a special connection. You have a date planned with a special someone, but you are nervous about how to present yourself. However, you find an app that helps you create fun and stylish outfits out of your wardrobe.

Task One: Go to the "scan" tab of the app and use the scanner to scan any article of clothing in your wardrobe using the camera on your phone.

Task Two: Confirm that the scan worked correctly, and the enter a name for the article of clothing that you scanned and add the item. Scan and add a few more different pieces of clothing.

Task Three: Use the outfits tab to scroll through the suggested outfits and try out all the options. You can add, delete, or favorite any outfit that is suggested. These outfits will be saved to "my outfits", deleted, or added to "favorites" accordingly.

Notes:

Changes:
- The menu system under the clothing tab and the way that you are given new outfit selections is a bit confusing
- Wardrobe/my clothes and outfits should be separated into two different main tabs (in the pursuit of simplicity it becomes confusing)
- You should be able to edit outfits

Keep:
- The graphics of the user interface are visually appealing and simple
- The process of scanning and adding new clothes is simple and easy to follow
- It is nice that you can do nothing with a suggested outfit if you aren't sure if you like it yet or not
